

# TUNNEL OF TREATMENT WITH SPRINKLERS

*Preventive wood treatment against  
the attacks of insects and mold*

Machine functions with less than 1000L of chemical solution, allowing it to operate without administrative authorizations due to large chemical storage.

A fork lift places the load into place, the door is closed and the load is then tilted at 45°.

The load of wood is sprayed back and forth by a fixture equipped with sprinklers. The route is programmable with a touch-screen application (up to 25 user programs).

The treatment solution is recirculated, using filters for the removal of sawdust and fragments of wood.

Inclined draining at 45°, with optional attached dryer that blows hot air. The load of wood is repositioned to be unloaded and the door can be opened.

Automatic replacement of reserve solution at the end of each cycle with volumetric dosing.

**Working with multiple solutions is available as option (IFH, colour, colourless, anti-blue,...).**
