

AUTOCLAVE

vacuum & pressure vessel for wood treatment

This machine is designed for wood forced impregnation, allowing class III or IV treatments.

It uses a preprogrammed Bethell cycle, or custom programs adapted to your needs.

Vacuum and pressure phases are reached quickly, using powerful pumps to save time on cycle transitions.

Assisted loading is available, with manual or automatic controls.

Automated dosing and mixing plant for concentrated chemical is also available as optional equipment.

Tilting of vessel during final vacuum reduces draining time, increases the quantity of chemical return to the service tank, and keeps the draining area cleaner.

Touch panel is used for selection of user program and cycle start, along with cycle watch and maintenance functions. Cycle data recording using a networked desktop PC is available as an option.
